## Foreword

In this manual, the settings and reference values for all Brookhuis Applied Technologies moisture meters for wood, building materials and paper are given.

The reference values determine the course of the calibration lines programmed in the moisture meters. These reference values originate from scientific research conducted by Brookhuis Applied Technologies and the following institutions.

- Building Technology (VTT) - Finland
- Bundesforschungsanstalt für Forst- und Holzwirtschaft (BFH) – Germany
- Danish Technological Institute (DTI) – Denmark
- Forest Research Institute Malaysia (FRIM) – Malaysia
- Forest Research Institute - New Zealand
- Forestry and Forest Products (CSIRO) – Australia
- Forintek Canada Corporation – Canada
- Norwegian Institute of Technology (NTI) – Norway
- Stichting Keuringsbureau Hout (SKH) - The Netherlands
- SHR Hout Research - The Netherlands
- Swedish Institute for Wood Technology Research (Träteknik) – Sweden
- TNO Building and Construction Research (TNO Bouw) - The Netherlands
- United States Department of Agriculture (USDA) - USA

As all of Brookhuis Applied Technologies instruments are microprocessor- controlled and the reference value data is stored in a memory, future expansion can take place using updates. As a result, Brookhuis Applied Technologies instruments are always up-to-date!

Enschede, 11 March 2015

Ing. P. Rozema

## Revision

This manual is written for the following instruments: S FMC from version 5.0

- FMD from version 5.0
- FME from version 5.0
- FMW from version 2.0
- FMI from version 3.0
- version 1.3 - Values FMW changed.

## 1 Characteristics

In this chapter the unit density, the oven-dry method and the moisture measurement with the Brookhuis Applied Technologies moisture meters are described.

### 1.1 Unit density

The formula for the unit density is:

$$\text{Unit density } Q \text{ [kg/m}^3\text{]} = \frac{\text{mass at moisture content at 0\% [kg]}}{\text{volume at moisture content at 0\% [m}^3\text{]}}$$

**(1)** Unit density

The unit density is used for moisture measurements with the FMI and FMW moisture meters.

- *For wood, the FMI and FMW are set at the average unit density applicable for a moisture content of 0%.*
- *For building materials and paper, the FMW is set at the reference line.*

## 1.2 Moisture content

The average moisture content of a sample is determined using the oven-dry method.

- *For wood, a sample of approx. 100-200 gram is weighed and then dried at 102-105 °C, until the mass of the sample is constant.*
- *For building materials and paper, we refer to the manual for the relevant measuring equipment.*

The formula for determining the moisture content according to the oven-dry method is:

$$\text{Moister content in [\%]} = 100 \times \frac{(\text{mass}_{\text{wet}} [\text{kg}] - \text{mass}_{\text{dry}} [\text{kg}])}{(\text{mass}_{\text{dry}} [\text{kg}])}$$

**(2) Moisture content according to the oven-dry method**

The Brookhuis Applied Technologies moisture meters calculate the actual moisture content, as determined by the oven-dry method.

### **1.3 CEN (European Committee for Standardization)**

EN 13183-1	Round and sawn timber Method of measuring moisture content  Part 1: Method for determining moisture content of a piece of sawn timber (Oven-dry method)
EN 13183-2	Round and sawn timber Method of measuring moisture content  Part 2: Method for estimating moisture content of a piece of sawn timber (Electrical resistance method)
EN 13556	Round and sawn timber Nomenclature of timbers used in Europa

### **1.4 In Practice**

Wood building materials and paper have an inhomogeneous composition.

- *Wood is constructed from various layers and often contains resin ducts, cavities, knots etc.*
- *Building materials and paper are different in composition and element size.*

As a result, variations can occur in the electric characteristics and unit density of samples of the same type with similar moisture contents and temperature. The smaller these variations are, the greater the accuracy of the moisture measurement.

## 2. Electric moisture measurement

Brookhuis Applied Technologies distinguishes the following two electrical measurement methods for determining the moisture content:

- *Moisture measurement by measuring the electric conduction (FMC, FMD, FME).*
- *Moisture measurement by measuring the dielectric constant (FMI<sup>1</sup>, FMW).*

### 2.1 Outline

The following points are important for accurate moisture measurements with the Brookhuis Applied Technologies moisture meters.

2.1.1 Wood species, building materials and paper		
FMC, FMD, FME	FMW	FMI
Every material has its own specific electric conduction.	Every material has its own specific unit density.	
The correct reference values must therefore be set. In chapters "Wood species" and "Building materials" and "Paper", the reference values are indicated.		

2.1.2 Temperature		
FMC, FMD, FME	FMW	FMI
Wood: As the wood temperature influences conduction, the correct wood temperature must be set. There is a choice of two temperature corrections.	The temperature has virtually no influence on a correct moisture measurement	

<sup>1</sup> The FMI cannot be used to determine the moisture content of building materials and paper.

<b>2.1.3 Accuracy</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
The material to be measured and the number of measurements determine the final accuracy of the moisture measurement. The reasons for this include the inhomogeneous composition and the moisture distribution.		
As a rule, the greatest accuracy is obtained when a number of measurements are taken.		See manual FMI.

<b>2.1.4 Measuring depth</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
Material that has been artificially dried will have higher moisture content at the core than at the edge.		
Wood: The moisture content of a piece of wood is determined at about 1/3 of the thickness of the wood. The reference values are also based on this. If the moisture content of the core of a thick piece of wood must be determined, the wood can be sawn in two in order to measure the core more easily.		Wood: The measurement is calibrated on the material to be measured.

<b>2.1.5 Measuring methods</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
Using insulated measuring pins, the moisture content is measured between the non insulated points of the measuring pins. The moisture content along the whole length of the measuring pin is measured using the non insulated measuring pins. It is typical that the highest moisture content is always measured between the non insulated part of the measuring pins.	The sensor measures the average moisture content to a depth of 25 mm. Wood: For wood with a thickness of less than 10 mm, several sections can be laid on top of one another. As it is possible to measure through the material, notice should be taken of what is behind the wood	See FMI manual.

<b>2.1.6 Measuring direction</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
In general, it is of no consequence whether the measuring pins are placed lengthwise or crosswise. Wood: Preferably crosswise to the grain.	In general, it is of no consequence whether the sensor is placed lengthwise or crosswise. Wood: Preferably crosswise to the grain.	See FMI manual

<b>2.1.7 Measuring surface</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
In principle, a rough or smooth surface has no influence on the measurement. If the surface is wetter than the depth to be measured, insulated measuring pins are to be used.	The surface should be clean, flat and smooth for an accurate measurement. It is possible to measure through a coating or a so-called surface course..	In principle, a rough or smooth surface has no influence on the measurement. It is possible to measure through a coating or a so-called surface course.

<b>2.1.8 Measuring range</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
Wood: Measurements below 7% and above the wood fibre saturation point are not accurate. For a precise determination beyond the measuring range, we recommend using the oven-dry method.	Wood: Measurements above the wood fibre saturation point are not accurate. For a precise determination beyond the measuring range, we recommend using the oven-dry method.	See FMI manual.

<b>2.1.9 Preservatives</b>		
<b>FMC, FMD, FME</b>	<b>FMW</b>	<b>FMI</b>
Measurements of treated materials are, in general, not accurate. For a precise determination, we recommend using the oven-dry method.	In general, preservatives and salt solutions do not influence the moisture measurements.	

### 3 Wood species

Reference values of wood species.

For the precise moisture meter software version, we refer to the relevant manual.
